

# BuddyU-Team 84

## Key achievements in the last week

- During the last week, we were able to accomplish a few key tasks that ensure that we will have a final working product by the end of this term.
- We were able to put a user's schedule in order by time.
- After selecting one of the user's buddies which adds them as a buddy, the user can now click a "View Schedule" button and see that buddy's specific class schedule.
- Additionally, because users have the ability to change their schedule at any time, users can see their buddies' schedules changing in real time. This is due to the Firebase real time database.
- Also, we have sufficiently completed both the System Manual and User Manual for the app.
- We have also conducted an initial survey of our app and have received some feedback that we will use while finished the app.
- Lastly, we have scheduled further testing to be done on our app before we implement final touches before the presentation next week.

## Key planned activities for the next week

- This week, we need to conduct user testing with at least 15 participants, gather responses, and implement corresponding changes to the app if we see fit.
- We are working on further developing the profile screen to include elements such as Name, Class Standing, and Major.
- Another task is conducting any final touches we may need to do, including updating the System Manual & User Manual if needed.
- Lastly, we start preparation for final presentation by creating a PowerPoint and prepare our demo.

## Plan to keep/get project to Green status

- In order to keep our project on Green status, we need to be mindful of our upcoming deadline to finish the app which is Friday of Week 10. It is important that we accomplish all the necessary tasks that keep our app in working condition. We also need to make sure that we do enough preparation for the final presentation. Also, we need to be sure to conduct enough user testing so that we get tangible feedback that we can use.

## Key risks / issues / scope changes

- Risks for this upcoming week include timing and ensuring we meet the deadline. We will need to schedule our week accordingly and give ourselves buffer time in case a task takes longer than expected.
- Other risks include user testing issues (if participants dropout) and last-minute bugs that need to be fixed.
