Brief Description
Connecting the firebase database to the Android Studio code
Will only do if time permits: connecting messages to database
The code on the laptop does not run when applied to the phone.
Have a user be able to add classes to their schedule and have it show up.
Allow user to register account using Facebook, Email, or Google
Incorporating Google, Facebook, and Email login options
Gathering users that can look at our app and tell us opinions about what they think.
Testing each of our seperate features that are marginalized in the drop down box
After unit testing we will come togther and examine if the screens and the features connect with each other
Switching between screens in app
Pulling course info from TMS
The user can change their profile image.
Update buddies screen so user can add other users and view their schedule.
This will make sure that when users try to add a buddy, the other user has to accept it before they can be your buddy.
The users show up here after the user is added as a buddy and is accepted as a buddy. On this screen, the user can also view their buddies schedules.
Allow the user to reset their password.
Lists the classes the user can add to their schedule. The user will be able to add classes to their schedule using this
Will do only if time permits: notifications, report a problem, terms and conditions.
With the class info pulled from Web TMS, upload JSON files to Firebase to allow the app to pull from it
We need to make a document that details all the requiremnets and parts of user testing
We want to be able to show that two of our screens effectively work together with data inputs

We need to gather at least 20 users to test our new product.	
We need to give each feature to each member to find errors that may occur.	
We need to work together to test this out
